## Vertical Market Application Case Study: Government Security

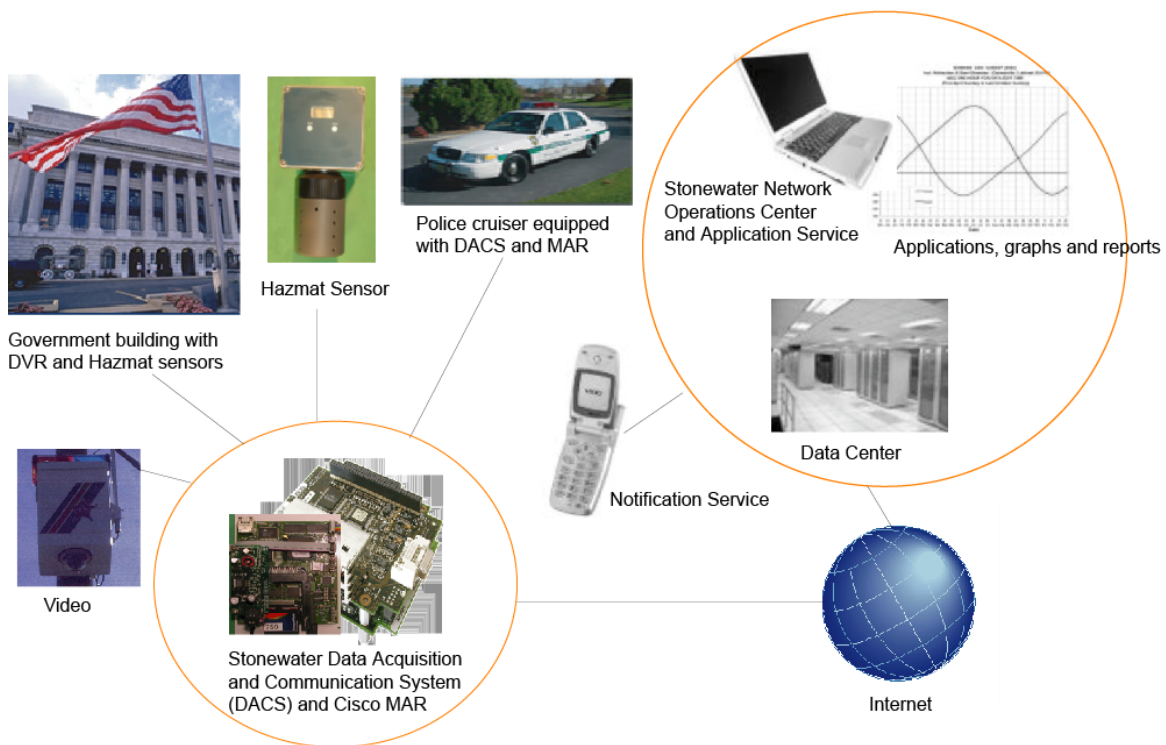

**Problem:** A county currently deploys video/DVR surveillance to monitor hazardous materials and the performance of devices in first responder vehicles but does not have a platform to measure the heartbeat of the system.

**Solution:** Stonewater Control Systems provides

an “end-to-end” networked solution that monitors the entire surveillance system and immediately notifies personnel of system failures. All data is accessible in all monitoring stations. Stonewater’s integration of its Data Acquisition and Communication System (DACS) into Cisco Mobile Access Routers (MARs) is

a key component for ensuring system reliability.

**Results:** Stonewater enables one of the first wide-scale security solutions of its kind, ensuring that the network security of first responder vehicles, sensitive facilities and government buildings is monitored 24/7.

Stonewater's DACS gathers information from sensors and video and immediately notifies personnel of system failures.
